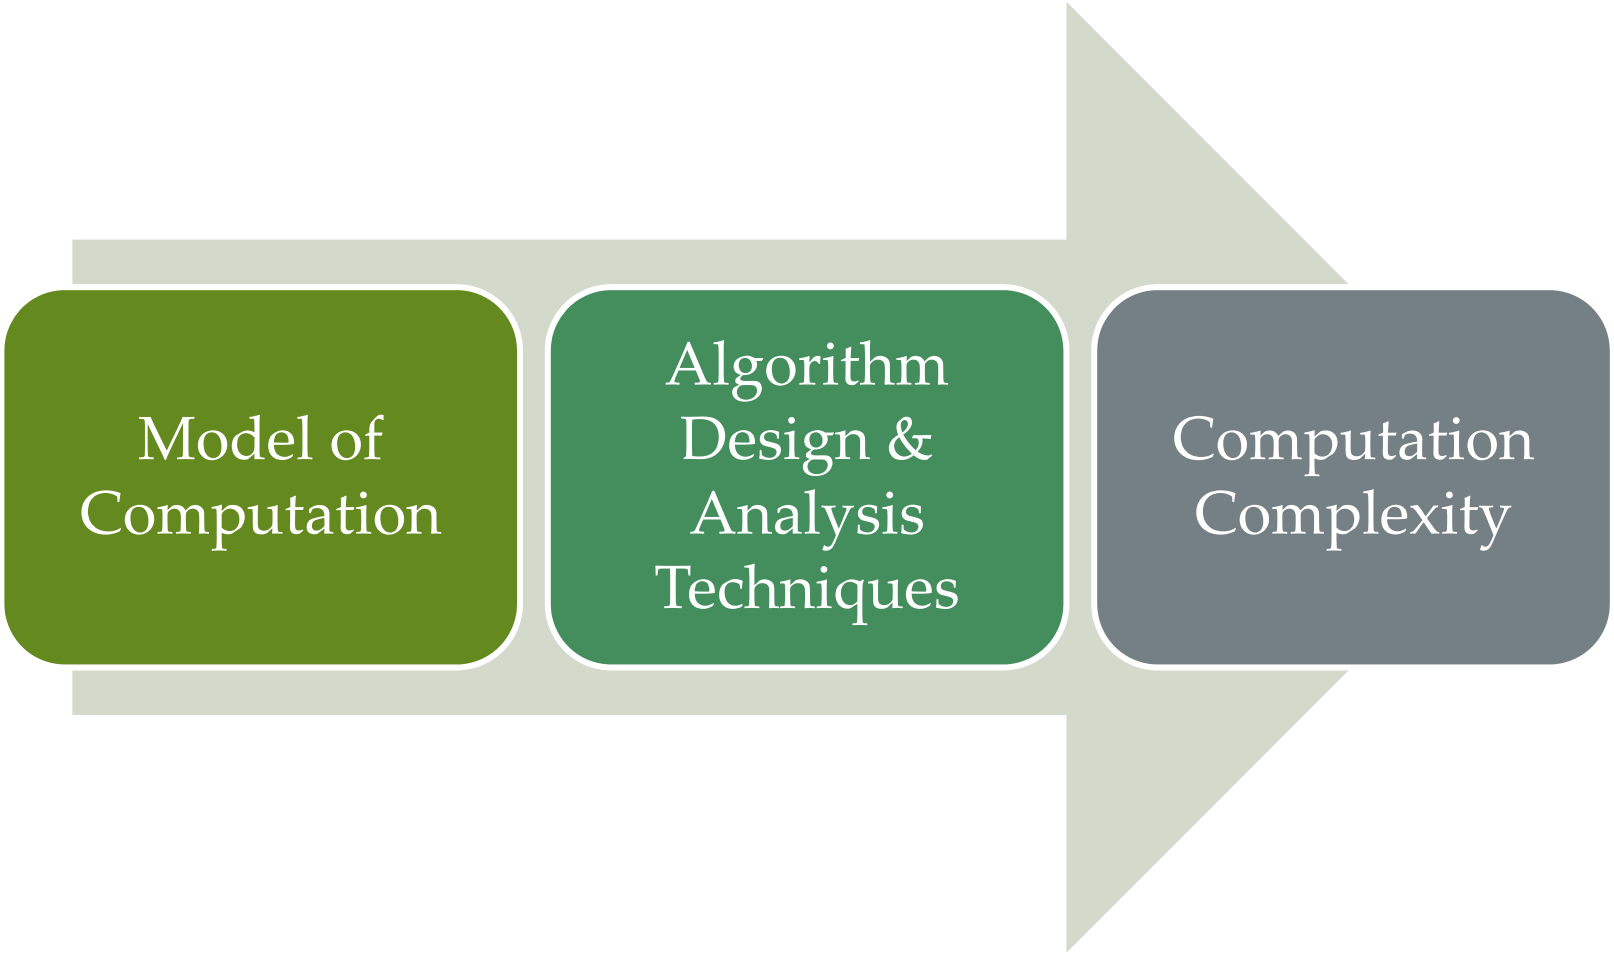
Course Information

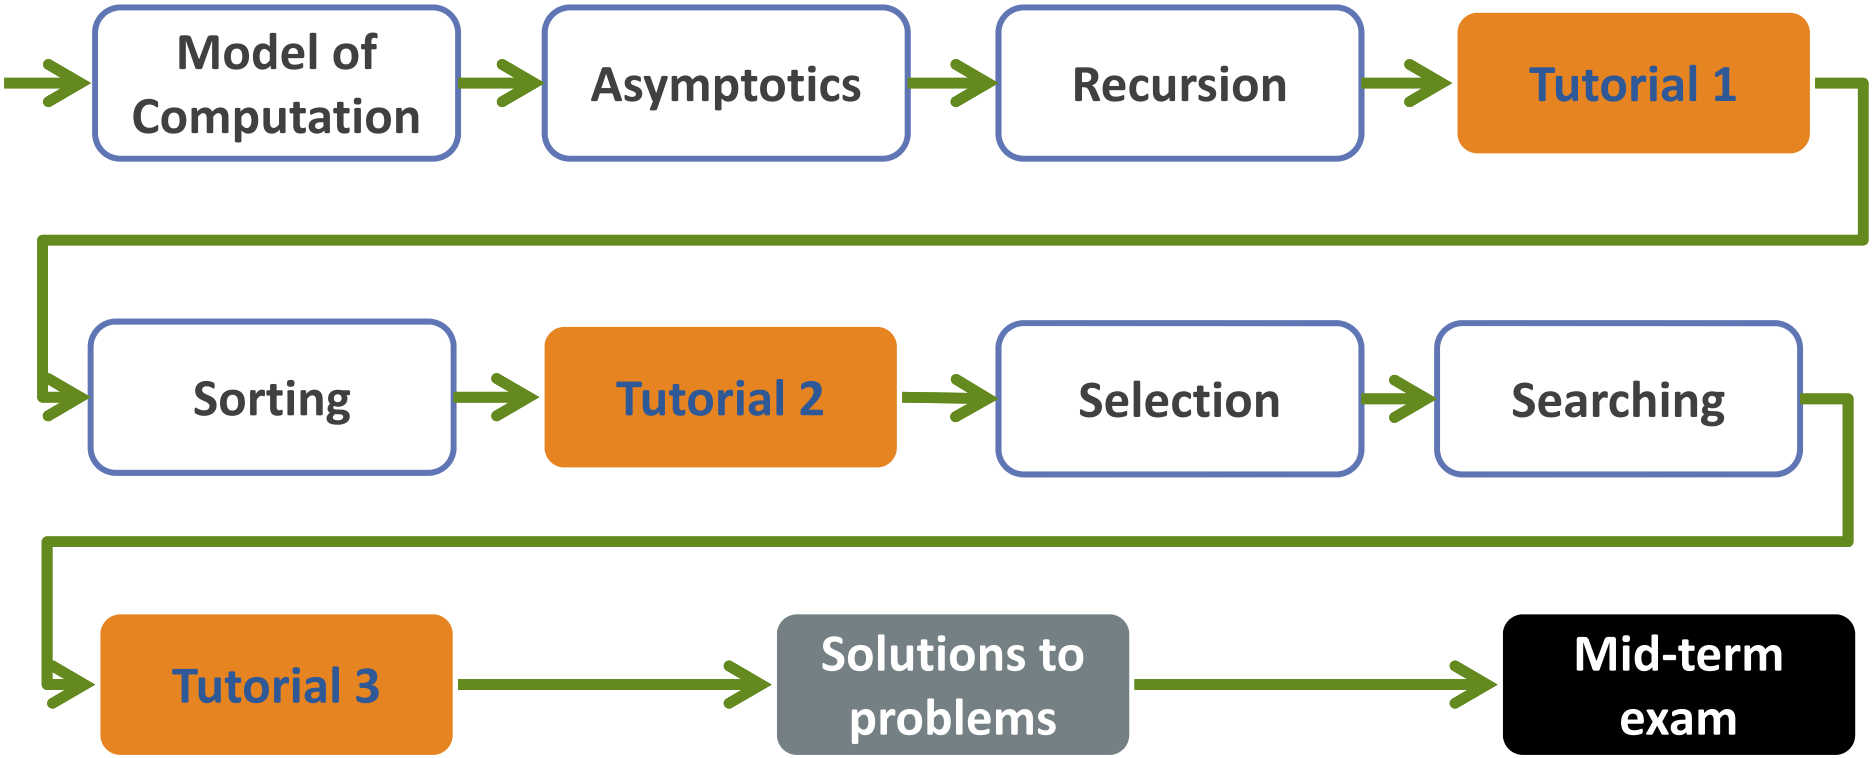
- **Syllabus**
- **Textbook**
- **Website**

Syllabus



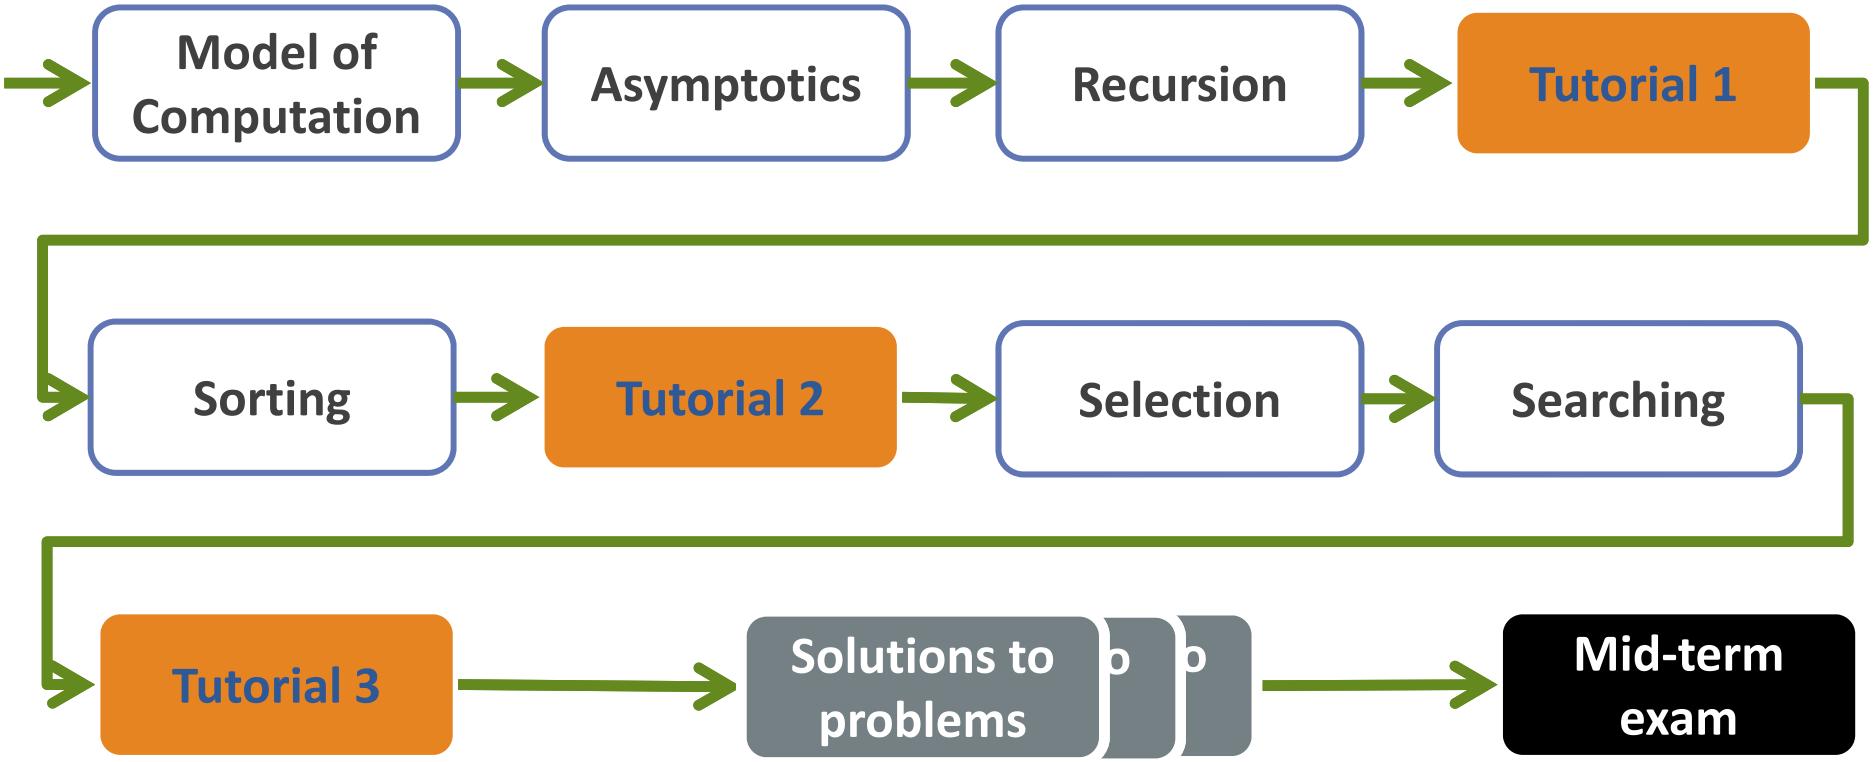
Model of Computation
Algorithm Design & Analysis Techniques
Computation Complexity

Syllabus



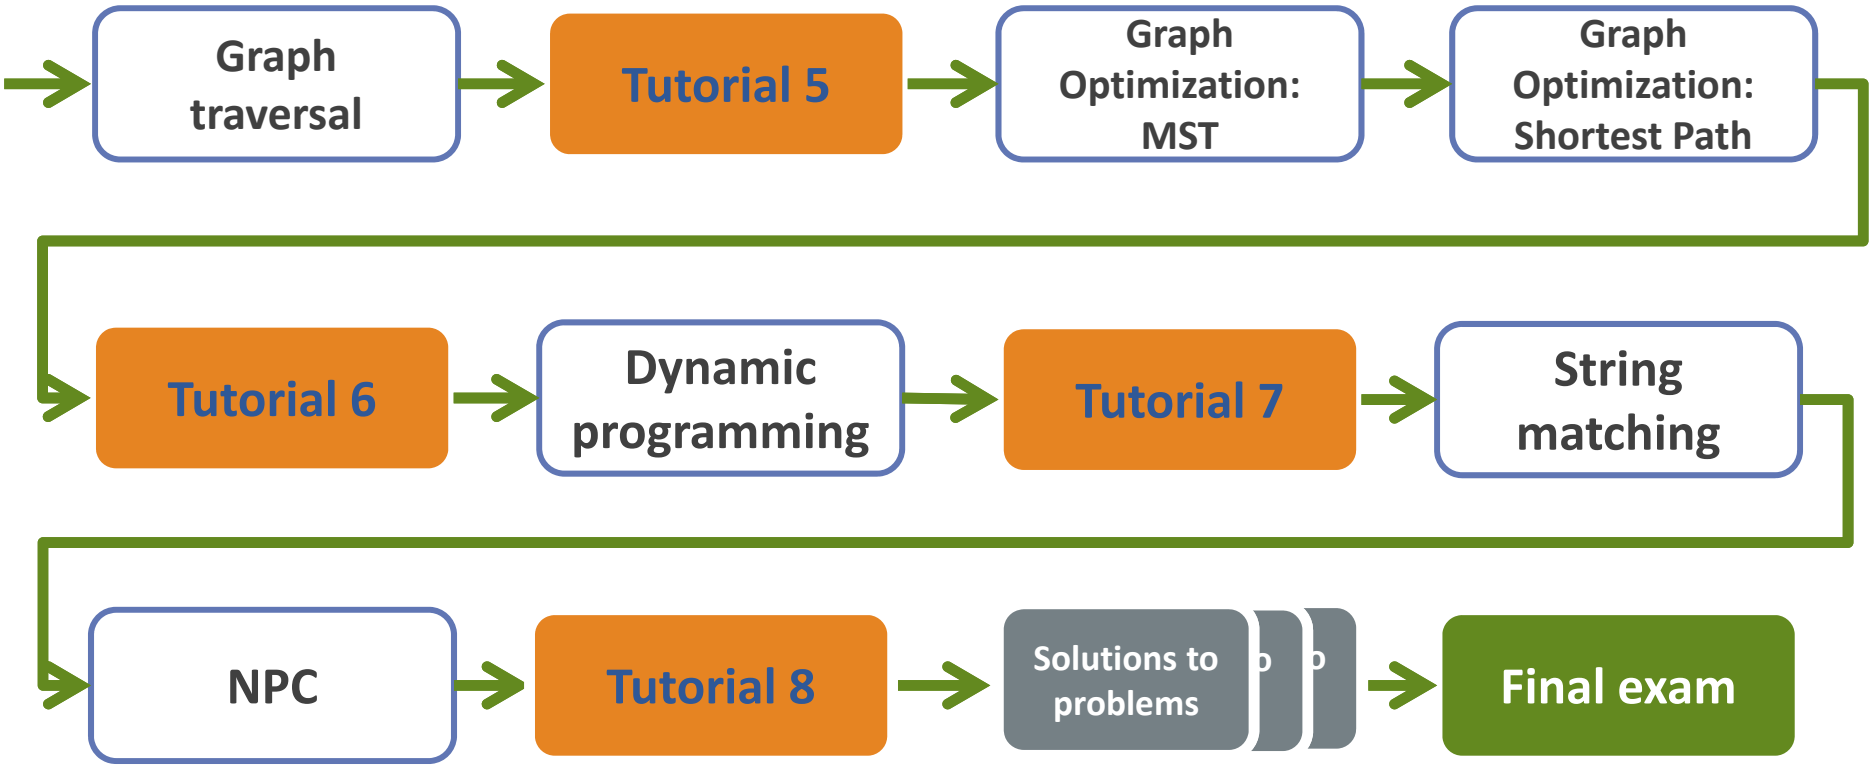
Model of Computation
Asymptotics
Recursion
Tutorial 1
Sorting
Tutorial 2
Selection
Searching
Tutorial 3
Solutions to problems
Mid-term exam

Syllabus



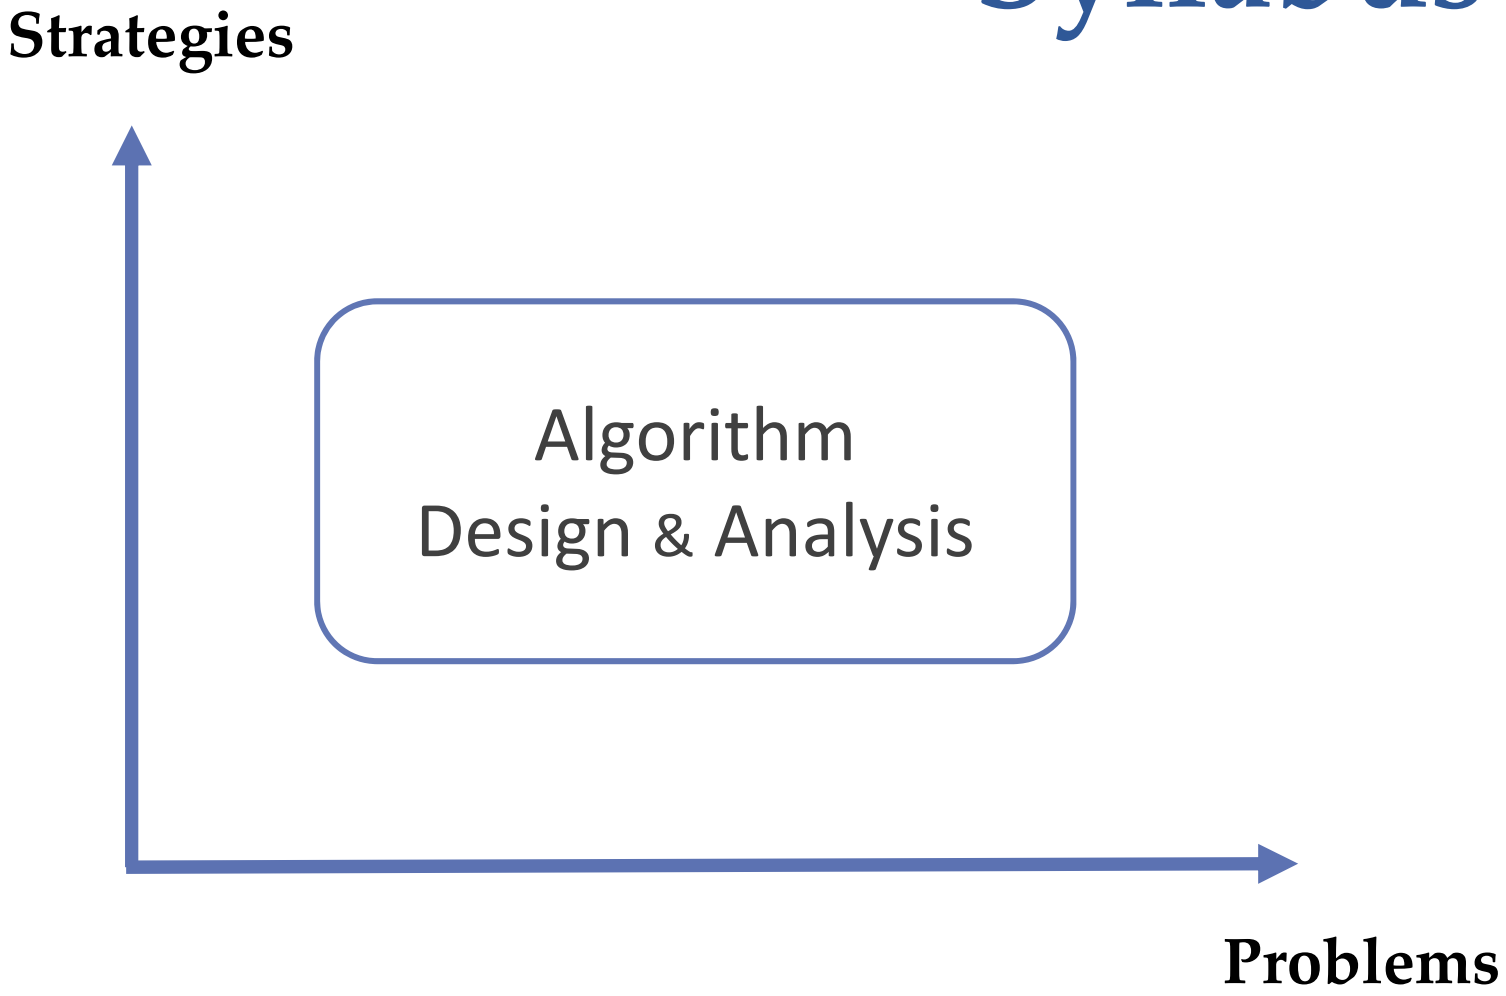
Model of Computation
Asymptotics
Recursion
Tutorial 1
Sorting
Tutorial 2
Selection
Searching
Tutorial 3
Solutions to problems
Mid-term exam

Syllabus

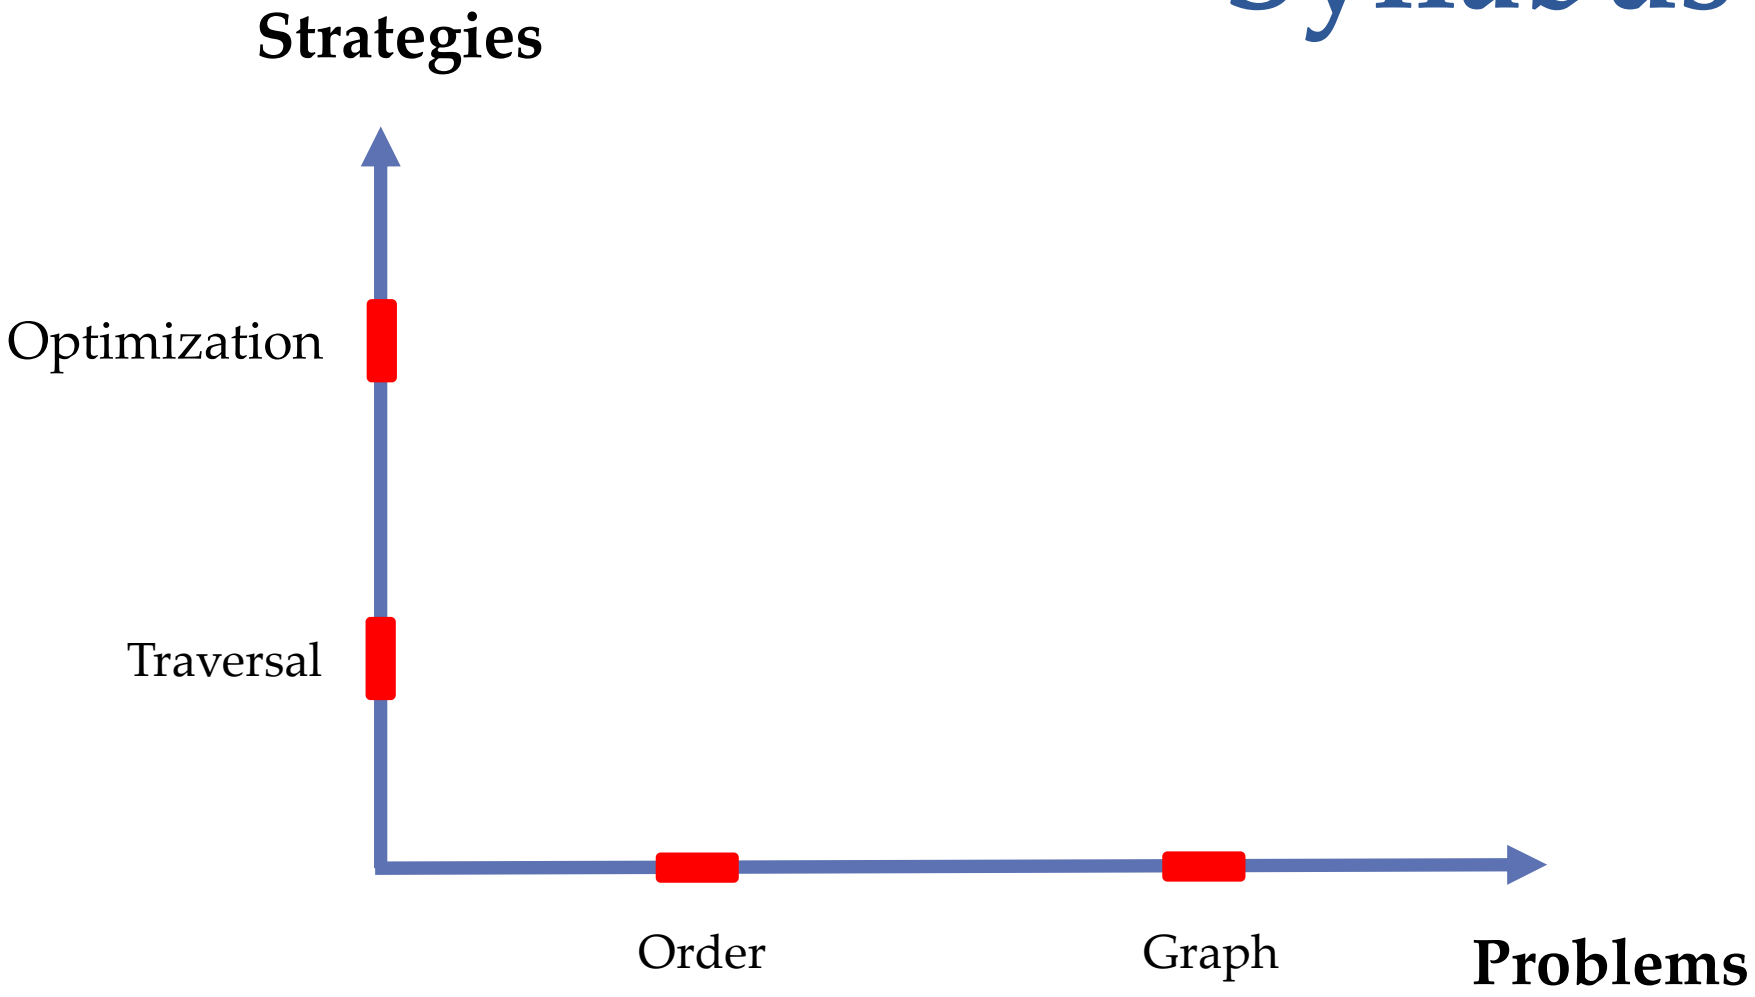


Graph traversal
Tutorial 5
Graph Optimization: MST
Graph Optimization: Shortest Path
Tutorial 6
Dynamic programming
Tutorial 7
String matching
NPC
Tutorial 8
Solutions to problems
Final exam

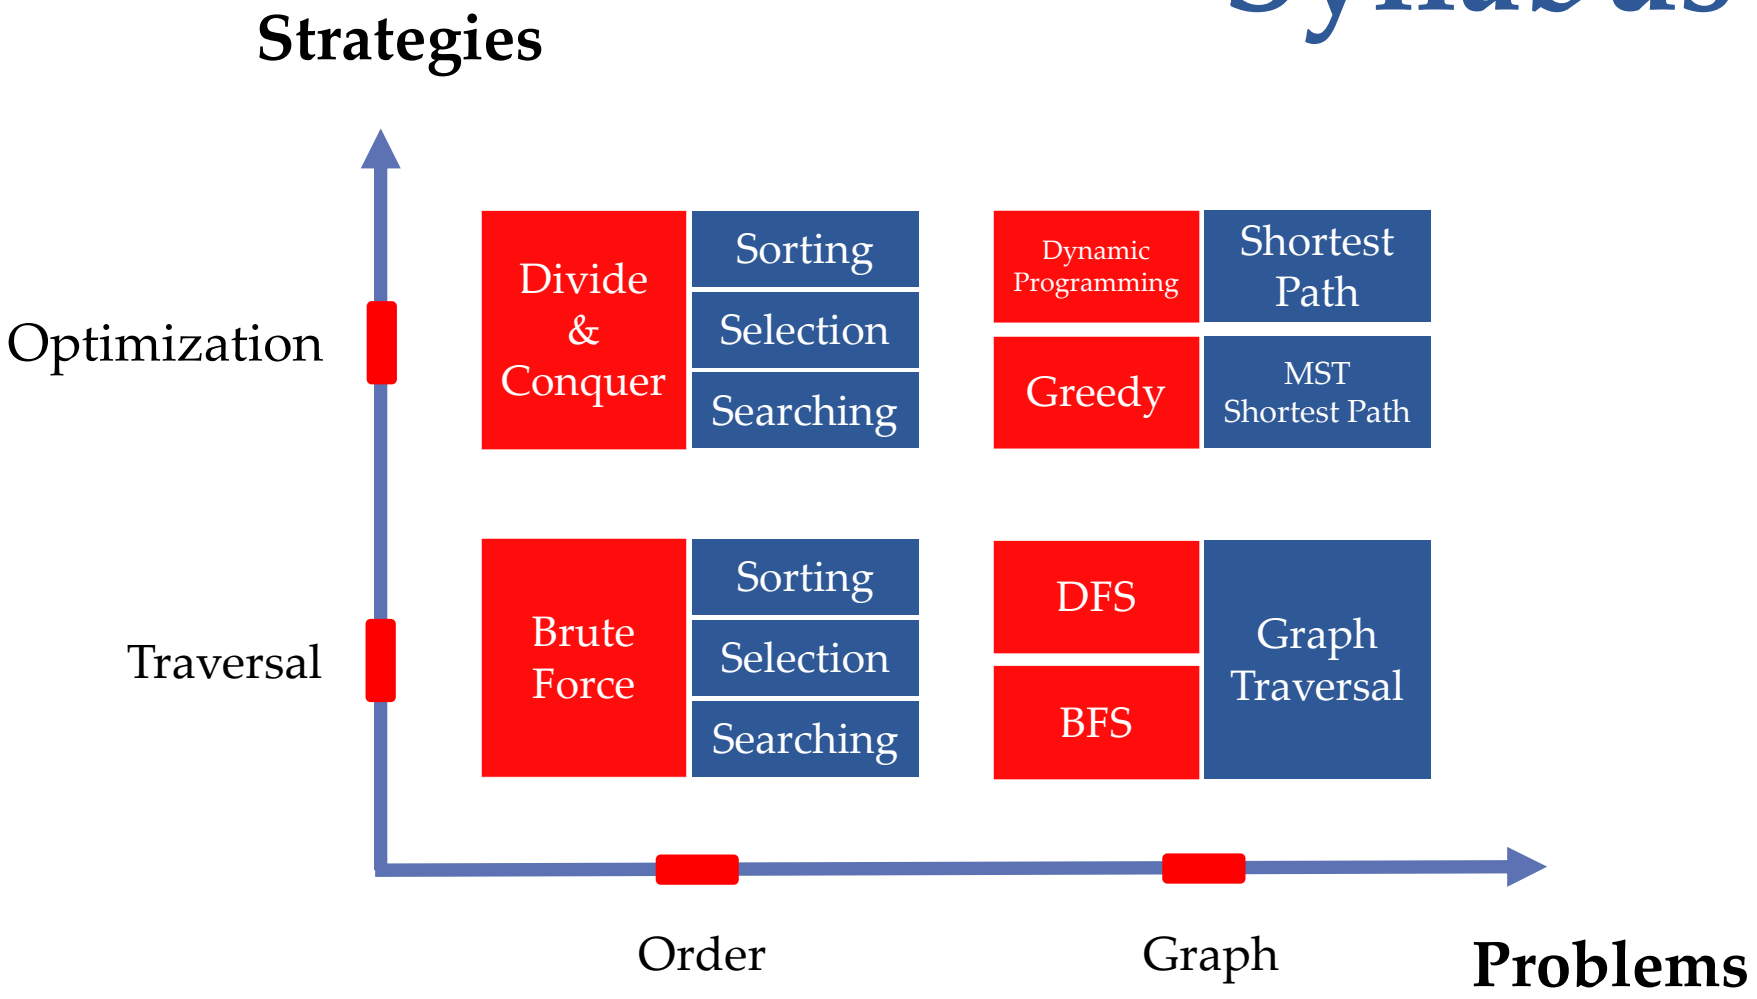
Syllabus



Syllabus



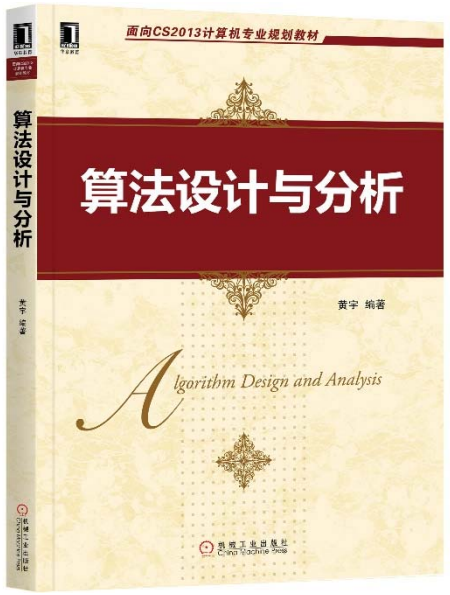
Syllabus



Strategies
Optimization
Traversal
Divide & Conquer
Sorting
Selection
Searching
Dynamic Programming
Shortest Path
Greedy
MST
Shortest Path
Brute Force
Sorting
Selection
Searching
DFS
BFS
Graph Traversal
Order
Graph
Problems

Textbooks

- **Course outline: LADA**
  - Lectures on Algorithm Design & Analysis (slides)
- **Course contents**
  - Algorithm Design and Analysis



More info about the book:
https://zhuanlan.zhihu.com/p/24150569

Textbooks

- **Further reading**
  - Introduction to Algorithms
  - Algorithm Design
  - Algorithms
  - Computer Algorithms*

See the "douban list" for more info:
http://book.douban.com/doulist/1155824/

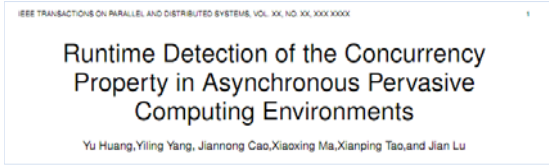
Algorithm – Design & Analysis

- **Algorithm - the spirit of computing**
  - Model of computation
- **Algorithm by example**
  - Greatest common divisor
  - Sequential search
- **Algorithm design & analysis**
  - Correctness
  - Worst-case / average-case cost analysis

Computer and Computing

- **Problem 1**
  - Why the computer seems to be able to do anything?
    - Scientific computing, document processing, computer games, ebooks, movies, computer games, …



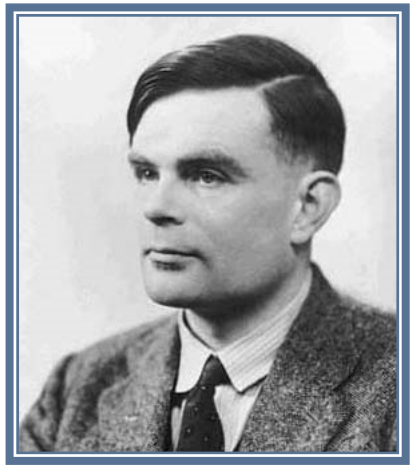
Computer and Computing

- **Problem 2**
  - What can / cannot be efficiently done by a computer?
    - Manage millions of songs vs. music composition

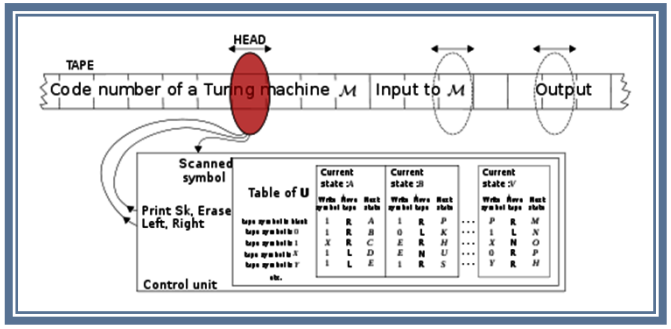
新歌TOP100			歌曲TOP500	
1	只是太爱你	张敬轩	没那么简单	黄小琥
2	绿旋风	凤凰传奇	走天涯	降央卓玛
3	好朋友只是...	郁可唯	漂亮的姑娘...	龙梅子
4	配角	sara	小三	冷漠
5	有时候	张靓颖	无法原谅	李佯璐
6	曾经太年轻	蓝又时	都要好好的	小沈阳
7	你和我的时...	张惠妹	老男孩	筷子兄弟
8	爱情掉在哪...	井柏然	我相信	杨培安
9	一瞬之光	a-lin	爱的供养	杨幂
10	狂想曲	萧敬腾	春天里	汪峰
更多>>		试听全部	更多>>	试听全部

Computer and Computing

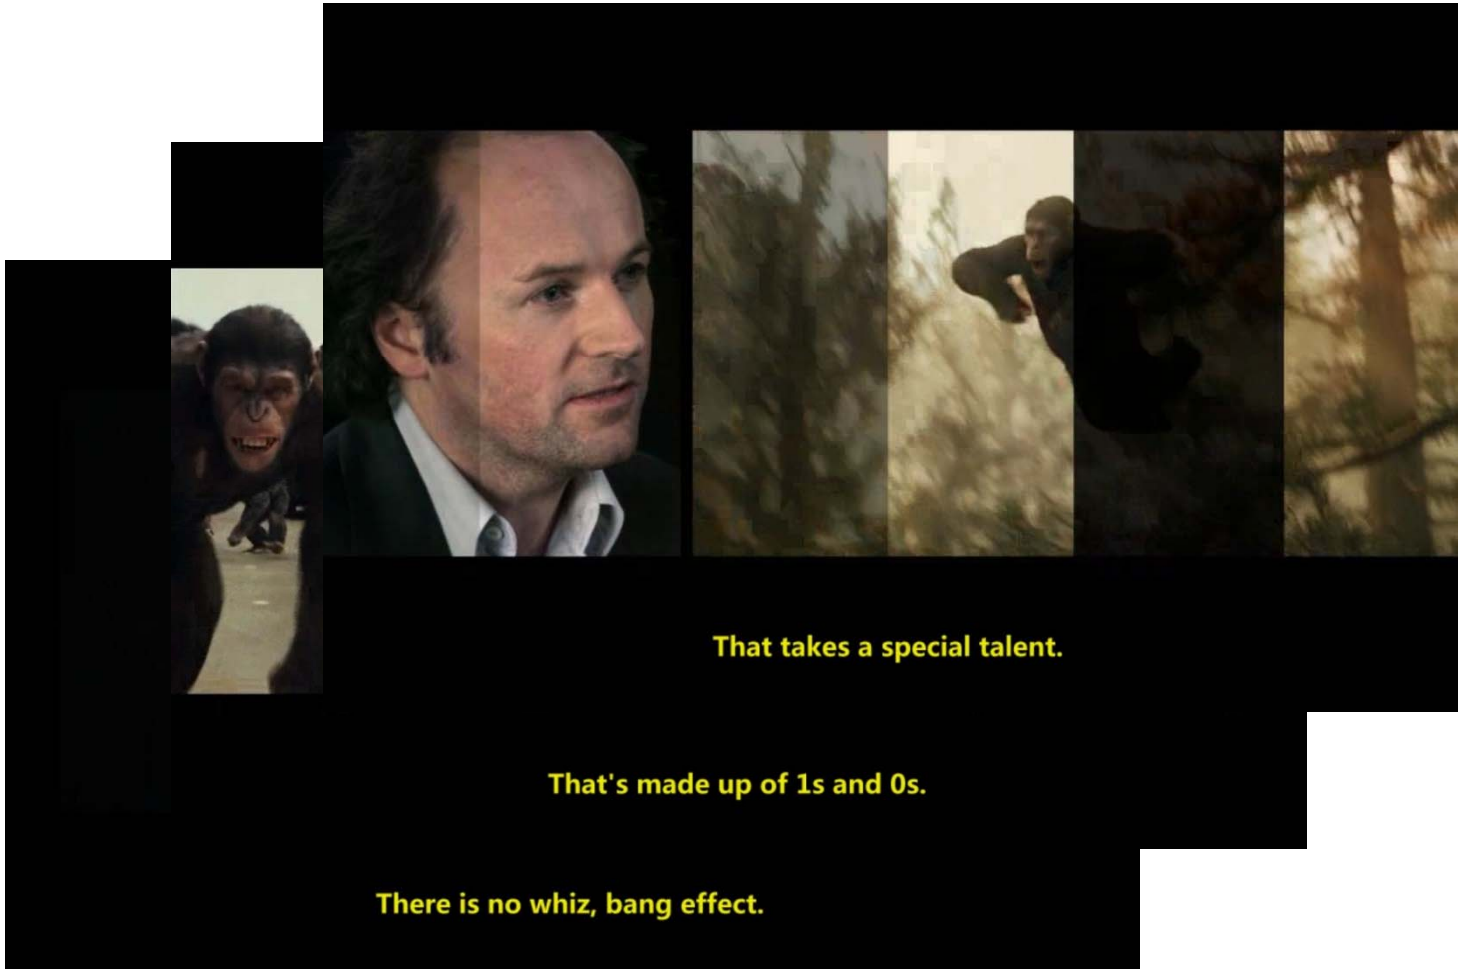
- **Computing**
  - Encoding everything into `0's and `1's
  - Operations over '1's and '0's
  - Decoding the '1's and '0's



- **Turing machine**
  - An abstract/logical computer



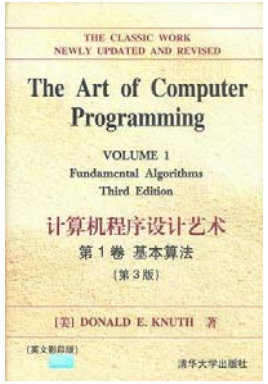
Computing in Everyday Life



Algorithm

Algorithm

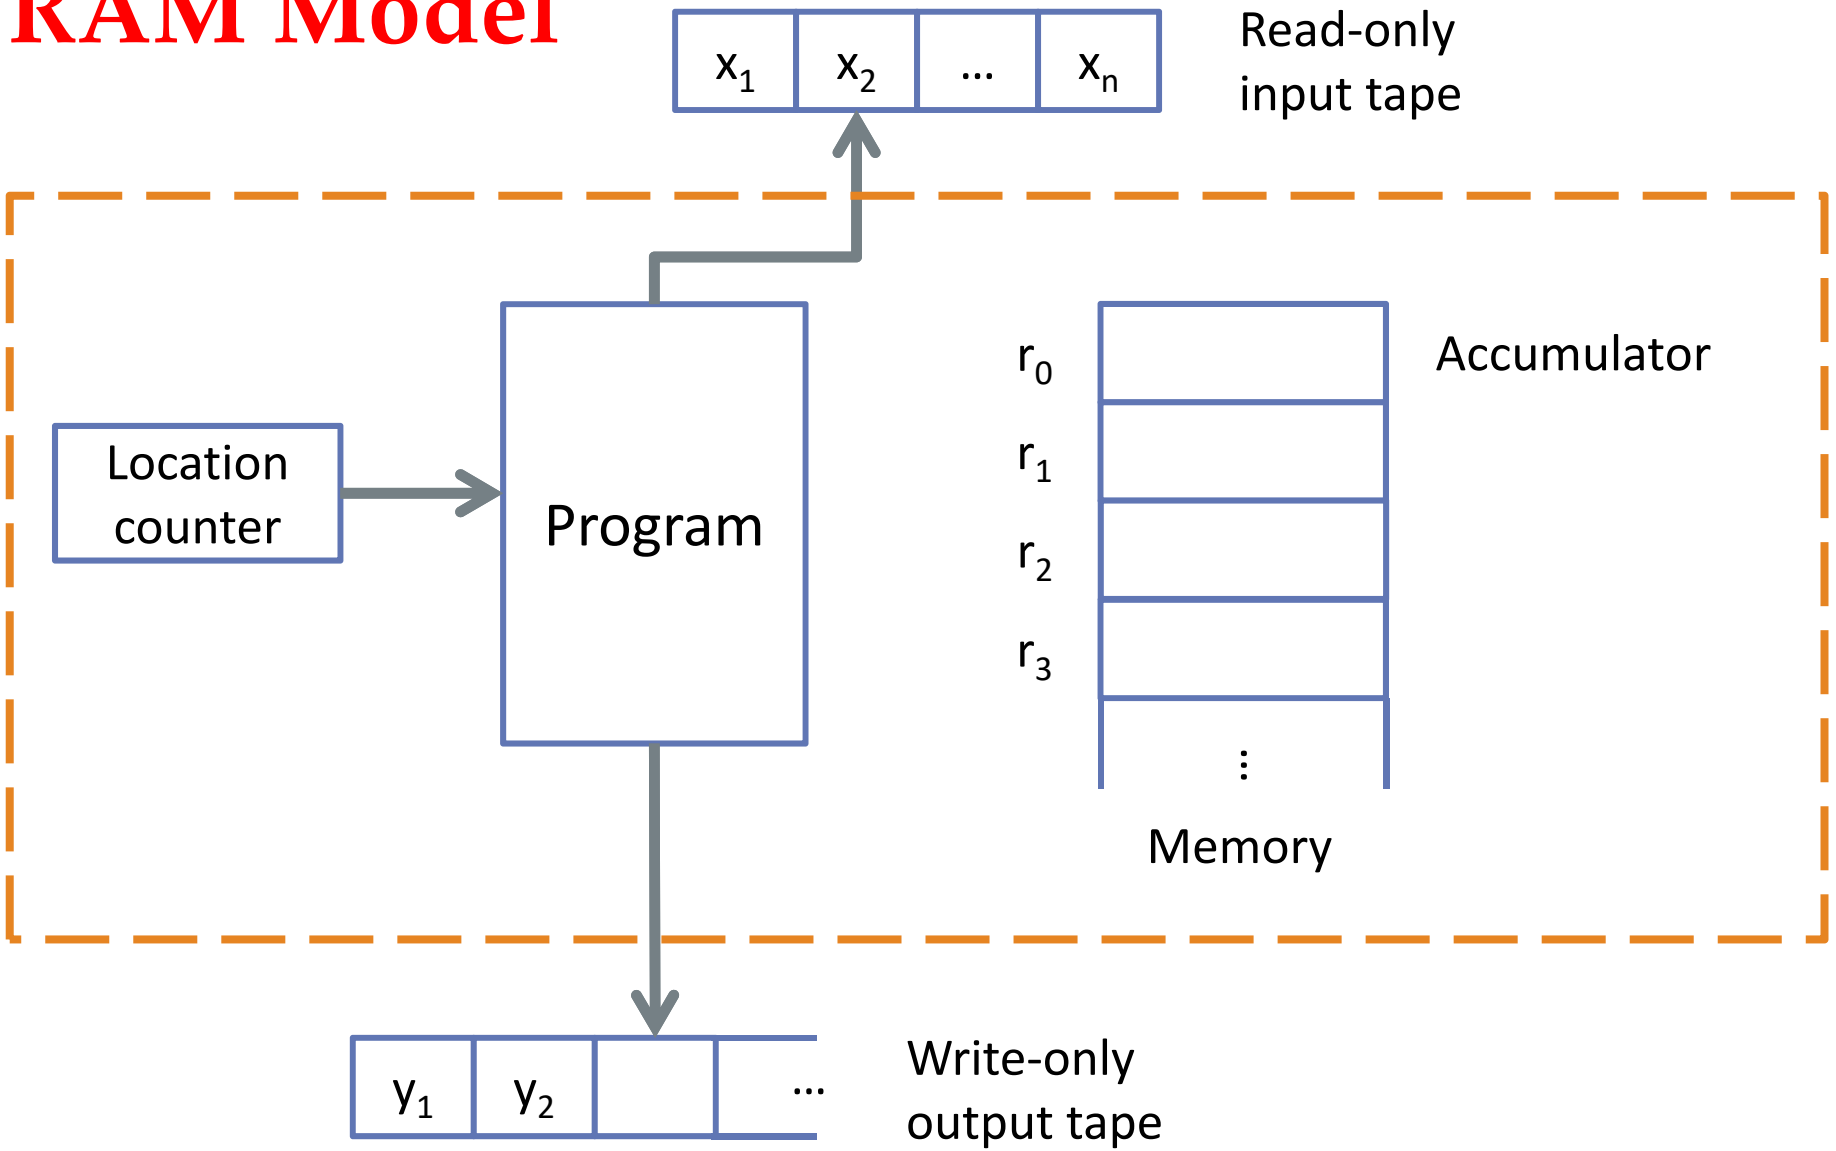
- **Algorithm is the spirit of computing**
  - To solve a specific problem (so called an *algorithmic problem*)
  - Combination of basic operations
    - in a precise and elegant way
- **Essential issues**
  - Model of computation
  - Algorithm design
  - Algorithm analysis



Model of Computation

- **Problems**
  - Why the algorithms we learn can run almost everywhere?
  - Why the algorithms we learn can be implemented in any language?
- **Machine- and language- independent algorithms, running on an abstract machine**
  - Turing machine: over-qualify
  - RAM model: simple but powerful

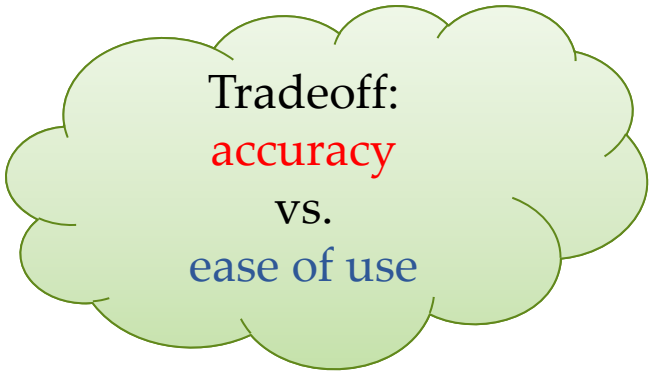
RAM Model



x_1 x_2 ... x_n
Read-only input tape
Location counter
Program
r_0
r_1
r_2
r_3
Accumulator
Memory
y_1 y_2 ...
Write-only output tape

The RAM Model of Computation

- **Each *simple operation* takes one time step**
  - E.g., key comparison, +/-, memory access, …
- **Non-simple operations should be decomposed**
  - Loop
  - Subroutine
- **Memory**
  - Memory access is a simple operation
  - Unlimited memory



Further Reading

“哼，你让他们成楔形攻击队形不就行了？”秦始皇轻蔑地看着冯·诺伊曼。牛顿不知从什么地方掏出六面小旗．三白三黑，冯·诺伊曼接过来分给三名士兵，每人一白一黑，说：“白色代表0，黑色代表1。好，现在听我说，出，你转身看着入1和入2，如果他们都举黑旗，你就举黑旗，其他的情况你都举白旗，这种情况有三种：入1白，入2黑；入1黑，入2白；入1、入2都是白。”

“不需要，我们组建一千万个这样的门部件，再将这些部件组合成一个系统，这个系统就能进行我们所需要的运算，解出那些预测太阳运行的微分方程。这个系统，我们把它叫做……嗯，叫做……”

“计算机。”汪淼说。

“啊——好！”冯·诺伊曼对汪淼竖起一根指头，“计算机，这个名字好，整个系统实际上就是一部庞大的机器，是有史以来最复杂的机器！”

刘慈欣，《三体、牛顿、冯·诺依曼、秦始皇、三日连珠》，《三体》第一部

To Create an Algorithm

- **Algorithm design**
  - Composition of simple operations, to solve an algorithmic problem
- **Algorithm analysis**
  - Amount of work done / memory used
    - In the worst/average case
  - Advanced issues
    - Optimality, approximation ratio, …

Algorithm by Example

- **Algorithmic Problem 1**
  - Find the greatest common divisor of two non-negative integers *m* and *n*

- **Algorithmic Problem 2**
  - Is a specific key *K* stored in array E[1..n]?

Probably the Oldest Algorithm

- **Euclid Algorithm**

Problem
- Find the greatest common divisor of two non-negative integers *m* and *n*

Specification

Input: non-negative integer m, n
Output: gcd(m, n)

Euclid algorithm

[E1] n divides m, the remainder -> r
[E2] if r = 0 then return n
[E3] n -> m; r-> n; goto E1

Euclid algorithm – recursive version

Euclid(m,n)
[E1] if n=0 then return m
[E2] else return Euclid(n, m mod n)

Sequential Search

Problem
- Search an array for a specific key

Specification

Input: K, E[1..n]
Output: Location of K (1,2,…,n; -1: K is not in E[])

Sequential searchEuclid algorithm

```
Int seqSearch(int[] E, int n, int K)
   int ans, index;
   ans=-1;
   for (index=1; index<=n; index++)
      if (K==E[index])
         ans=index;
         break;
   Return ans;
```

Algorithm Design

- **Criteria**
  - Defining correctness
- **Main challenge**
  - For proving correctness
- **Our strategy**
  - Mathematical induction
  - …

Specification

Input: non-negative integer m, n
Output: gcd(m, n)

Main challenge

- The output is **always** correct, for **any** legal input.
- Infinite possible inputs

Mathematical induction

- Weak principle
- Strong principle

For Your Reference

- **Mathematical induction**

The Weak Principle of Mathematical Induction

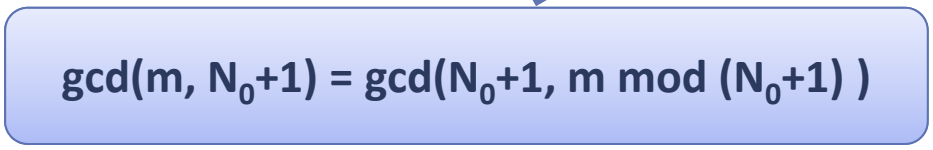
- If the statement p(b) is true and the statement p(n-1) => p(n) is true for all n>b, then p(n) is true for all integers n>=b.

The Strong Principle of Mathematical Induction

- If the statement p(b) is true, and the statement {p(b) and p(b+1) and … and p(n-1) => p(n)} is true, for all n>b, then p(n) is true for all integers n>=b.

Correctness of the Euclid Algorithm

- **Induction on n**
  - Base case
    - n = 0: for any m, Euclid(m, 0) = m;
    - n = 1: for any m, Euclid(m, 1) = 1;
    - n = 2: …
  - Assumption
    - For any $n \le N_0$, Euclid(m, n) is correct;
  - Induction
    - Euclid(m, N_0+1) = Euclid(N_0+1, m mod (N_0+1));



Notes on Induction

"Notes on Structured Programming", E.W. Dijkstra

I have mentioned **mathematical induction** explicitly, because it is the only pattern of reasoning that I am aware of, that eventually enables us to cope with loops and recursive procedures

Algorithm Analysis

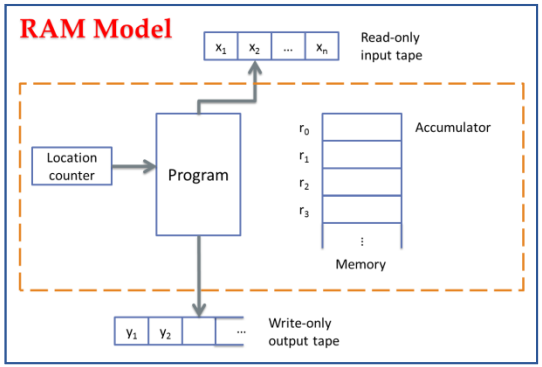
- **Criteria**
  - Performance metrics
- **Worst case**
  - Best case?
- **Average case**
  - Average cost?
- **Advanced topics**
  - Lower bound, optimality, …

Algorithm Analysis

- **How to measure**
  - Not too general
    - Giving essential indication in comparison of algorithms
  - Not too precise
    - Machine independent
    - Language independent
    - Programming paradigm independent
    - Implementation independent

Algorithm Analysis

- **Criteria**
  - Critical operation
  - How many critical operation are conducted
- **For example**



Algorithmic problem	Critical operation
Sorting, selection, searching String matching	Comparison (of keys)
Graph traversal	Processing a node/edge
Matrix multiplication	Multiplication

Algorithm Analysis

- **Amount of work done**
  - usually depends on size of the input
  - usually does not depend on size of the input only

Worst-case Complexity

- **W(n)**
  - Upper bound of cost
    - For any possible input
  - $W(n) = \max_{I \in D_n} f(I)$

Average-case Complexity

- **A(n)**
  - Weighted average
  - $A(n) = \sum_{I \in D(n)} \Pr(I)\, f(I)$
- **A special case**
  - Average cost
    - Total cost of all inputs, averaged over the input size
  - $Average(n) = \frac{1}{|D(n)|} \sum_{I \in D(n)} f(I)$

Average-case Cost of *SeqSearch*

- **Case 1: K is in E[]**
  - Assumptions:
    1. Assuming that K is in E[]
    2. Assuming no same entries in E[]
    3. Each possible input appears with equality (thus, K in the i^{th} location with probability $\frac{1}{n}$)

  - $A_{succ}(n) = \sum_{i=0}^{n-1} \Pr(I_i|succ)\, t(I_i)$

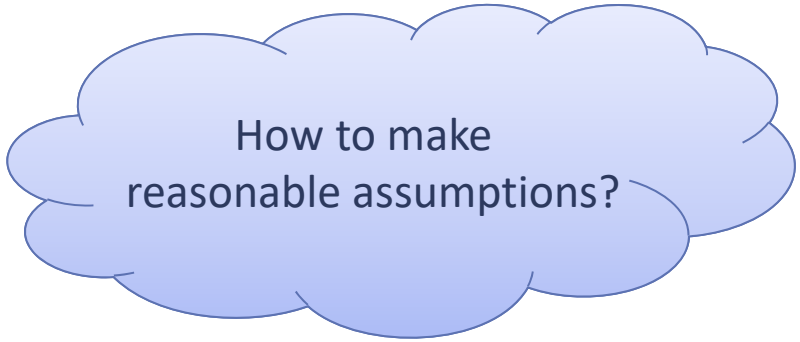
    $= \sum_{i=0}^{n-1} \frac{1}{n}(i+1)$

    $= \frac{n+1}{2}$

Average-case Cost of *SeqSearch*

- **Case 2: K may (or may not) be in E[]**
  - Assume that K is in E[] with probability q
  - $A(n) = \Pr(succ)\, A_{succ}(n) + \Pr(fail)\, A_{fail}(n)$

    $= q\frac{n+1}{2} + (1-q)n$



Algorithm Analysis

- **Advanced topics**
  - Lower bound (Selection)
  - Optimality (Greedy, DP)
  - Computation complexity
  - Approximate / online / randomized algorithms

Thank you!

Q & A

Yu Huang

Question
Introduction to Algorithms (book)
Computer Programming
How many people have read all of "Introduction to Algorithms"?
Many people suggest this book when asked about algorithms or programming in general. I have this book and it is BIG. I'm wondering how many people have actually read this cover to cover.

I have. And I mean truly cover to cover. I've even read the index.
